WashKrew

Aman + Claude: current iPhone acceptance guide

30 October 2026 | staging | Customer + Captain + private admin

Use this guide instead of the 28/29 October PDFs. The current functional source includes **cedd9ab**, following Aman's **79d17af**. Pull current staging and record the full resulting commit. Keep Aman's camera, location, background-save and paid-team changes. Keep the approved designs; do not rebuild old af036f0 as the app.

Give Claude this instruction

"Read this entire PDF, AGENTS.md, CLAUDE.md and the latest reports. Preserve my local work and build both current Flutter iPhone apps from staging. Guide me through this PDF one role and one action at a time. Explain the expected result and wait for my observation. Record PASS, FAIL, BLOCKED or NOT RUN with safe evidence. Preserve the existing UI. Reproduce functionality failures before a narrow fix and retest. I enter passwords, SMS codes, bank details and UPI PINs; I decide real approvals and payments. Do not create production test fixtures, change global payment mode, invent success or put private files in Git. Ajay's side handles Firebase APNs upload after my private key handoff."

The role sequence

CAPTAIN signs up -> ADMIN reviews -> CAPTAIN goes Online -> CUSTOMER books -> CAPTAIN accepts and washes -> CUSTOMER approves/rates -> CAPTAIN sees earnings.

Open	Address or app
Customer	Native WashKrew app; Customer web
Captain	Native Captain app; Captain web
Private admin	https://wheelio-apps.web.app/admin/

Current verification: 138 backend/rules tests, 70 Flutter tests, four analyses and both release web builds passed. Functions/configuration and hosted artifacts were verified. Those results do not establish Xcode signing, camera/GPS, APNs, native payment switching or physical acceptance. Record actual device evidence. Production checkout is **LIVE**. A normal build is not a payment sandbox.

2. Pull and build both apps on the Mac

Use Flutter **3.38.6**, compatible Xcode/iOS SDK and CocoaPods. Connect, unlock and trust the iPhone; complete Developer Mode and Apple sign-in as the human. Keep the existing paid Apple team **28JNT7H8KA** (Sumit Mandal). The earlier personal team is historical and must not be restored.

```
git status --short
git fetch origin staging
git switch staging
git pull --ff-only origin staging
git rev-parse HEAD
flutter doctor -v
bash apps/flutter/tool/run-ios.sh --prepare
open apps/flutter/customer/ios/Runner.xcworkspace
open apps/flutter/captain/ios/Runner.xcworkspace
```

If local work exists or pull cannot fast-forward, preserve and inspect it first. Do not hard-reset, overwrite work or force-push. There are exactly two current apps, both Flutter. Open **Runner.xcworkspace**, including Pods, for each app.

App	Keep bundle ID
Customer	com.amanmaheshwari.wheelio.customer
Captain	com.amanmaheshwari.wheelio.captain

In Runner -> Signing & Capabilities, verify the paid team and automatic signing. Keep existing push entitlements, camera, Photos, microphone and location purpose strings. Do not recreate Firebase apps, bundle IDs, native projects or keys.

```
bash apps/flutter/tool/run-ios.sh
# If several physical iPhones are connected:
bash apps/flutter/tool/run-ios.sh --device IPHONE_ID
```

The tool resolves locked Dart dependencies, prepares Pods, builds and installs both Release apps. Use no --demo option. Merchant secrets and Firebase owner CLI login are not needed for the normal client build. Check the actual errors before changing a dependency; preserve Aman's native source and lockfiles. Launch both apps after disconnecting Xcode. Record versions, build numbers and device/iOS.

Reinstall/rebuild the Customer app. The new cancellation terms require the updated client acknowledgment; an older binary must not silently accept them.

3. CAPTAIN -> ADMIN -> CAPTAIN ONLINE

1. Arrange real consenting roles

Use **two different real mobile numbers**, one per role. A Captain cannot accept their own Customer booking. Both apps can coexist on one iPhone. For a second view, keep Captain on the phone and Customer web on the Mac; separately test native Customer too. One phone cannot prove simultaneous foreground behavior.

2. Open Captain and submit genuine documents

Complete language/welcome and real SMS login. Aman enters the OTP in the app. Check wrong code, edit number and permitted resend recovery once. A new account must be unapproved and unable to take jobs.

On Aadhaar, use **Upload Aadhaar photo**, then camera/gallery/cancel. Cancel once, retake if needed and verify the actual upload survives reopen. There must be no Open DigiLocker action. Complete selfie and genuine payout information. Keep the current guided camera UI. Failed uploads cannot count as saved or approved.

Set requested society and real work hours/breaks within **4 AM-10 PM**. Reopen and check exact minutes. Submit through the existing rules flow. Expected: **Under review**. Training videos, quiz and refresher entries stay hidden and not required.

3. Open private admin on the Mac

https://wheelio-apps.web.app/admin/

Allowed Google reviewers: **amanmaheshwari900@gmail.com**, **ajay@trustkeyper.com**, **ajaybhatnagar1712@gmail.com**, **info@trustkeyper.com**. An unrelated account must not review or approve. The human inspects the uploaded private evidence and requested societies and decides whether to request corrections or approve. Claude guides; it does not approve a person as a test or edit the database.

Check a genuine correction/resubmission if needed. Only eligible approved societies should be assigned. Do not fabricate documents or self-review around an enforced restriction; use another authorized reviewer when appropriate.

4. Return to Captain

Confirm approval appears. Go Online and keep the app foreground and connected. Verify approved coverage, saved overlapping hours/breaks and no restriction or conflicting active job. Approval alone does not create capacity; Online, current heartbeat, coverage, time, eligibility and LIVE payment mode must also match.

4. CUSTOMER -> availability -> real payment

5. Customer login, vehicle and place

Use the second number: Profile -> Log in -> real OTP -> name. Check session/name persistence, empty states, vehicle/plate and optional photos. Save the actual served society, tower, floor and parking. Check the current Locate me control, permission denial/retry, map selection and reopen. Optional text/voice/video notes must persist; a failed upload must not look saved.

6. Match real capacity before paying

Choose the same active society and a day/time overlapping the approved Online Captain's exact saved hours. Customer windows cover **4 AM-10 PM**. Check the existing all-day/flexible/time controls and the final time summary. A saved break must remove incompatible capacity. A different society/offline Captain should not create false availability. Server checks at payment and assignment remain authoritative even when a cached list was shown.

Measure cold first opening and a repeat opening on the actual phone. Record the time to real available/unavailable slots and the network condition. Startup preload/cache improvements are included; no paid warm minimum is enabled and no zero-latency promise is made. If capacity is absent, diagnose eligibility rather than removing its guard or placing an unfulfillable payment.

7. Review and checkout

Check total, wallet credit used, cash due, place and time before continuing. Read the **five-minute cancellation terms** on the existing Review card. Use the existing credit toggle to test with/without available credit; do not invent a wallet balance or bypass account ownership.

Razorpay must show unrestricted supported **UPI apps**, **debit cards**, **netbanking** and **provider wallets**. Google Pay is not the only UPI choice. Direct credit cards, EMI, cardless EMI and pay-later stay hidden. Credit-linked UPI remains allowed by the owner's decision. Device/app/provider eligibility may affect individual options; record what the live chooser actually exposes.

Cancel checkout once: no paid booking or duplicate debit. Retry the same booking. Only the human authorizes a real charge and enters bank/UPI details. Record the authorized amount and actual capture; no agent makes a charge as a test. Return from the payment app and reopen to verify server recovery without duplicate pay. Fully covered wallet bookings must not open Razorpay or charge cash.

5. CAPTAIN accepts -> wash -> CUSTOMER approval

8. Offer and arrival

After payment confirmation, Captain must receive the genuine matching offer. Accept it and confirm both apps refer to the same booking/time/place. A second Captain cannot claim an already assigned job. Check offer expiry/offline recovery without forcing an acceptance. Customer must show actual assignment/status.

Use arrival/navigation controls with the real vehicle location. Check foreground GPS updates in Customer and a clear stale/unavailable state when tracking stops; do not expect continuous iOS background tracking beyond implemented permissions. Test an actual fresh selfie session; old uploads, failed verification or denied camera cannot grant entry. Photo checks are advisory and do not replace human KYC.

9. Before photos, Washing, after photos

Take/upload all **four before photos** in the existing angle order. Cancel and retake once. Missing/unuploaded photos must block starting. Start wash and verify the Customer's real-time status changes to Washing. Reopen either app during the job and confirm the current server state, with no second job or lost photos.

Take/upload all **four after photos**, verify angles and failed-network recovery, then submit completion. Check quality guidance and retry handling. No local timer or placeholder must manufacture evidence, successful completion or approval.

10. Customer review, rating and history

Open Customer's completed wash and inspect all required before/after angles. The human chooses whether to approve. Exercise genuine issue reporting if needed; do not file a false dispute solely to test. Dispute outcomes remain human ops.

After approval, submit a rating once. Reopen history and download the actual receipt on the iPhone. Verify the booking amount and status agree in both roles. Captain should have **one** approved earning; duplicate taps/callbacks must not double it. An earning in the ledger is not a completed bank payout. Only actual human payout processing plus confirmed provider/bank evidence establishes payment.

Recovery evidence

Record the failing role/screen, exact safe error, steps, source commit, expected and observed behavior. Keep identity images, private locations, phone numbers, payment IDs and financial screenshots outside Git/shared test reports. Retest only the affected path and required related checks after a narrow code fix.

6. Cancellation and wallet acceptance

These rules apply to **new bookings** that saved refundThenCredit. Existing bookings keep their original saved terms and merchant/mode. Do not change an old order to test the new policy. The five-minute window begins at the first server booking confirmation, not when checkout opens. Washing closes self-cancellation.

Case	Expected result
INR 149 cash, within 5 minutes	Refund INR 149 to the original method; fee zero.
INR 149 cash, later, before washing	Fee INR 74.50; WashKrew wallet gets INR 74.50; no bank refund.
INR 150 total: INR 100 cash + INR 50 wallet, within 5 minutes	Original cash refund INR 100 and restore INR 50 wallet; fee zero.
Same mixed booking, later	Fee INR 75 and wallet return INR 75 total; do not add the old INR 50 again.
INR 150 entirely wallet, later	Fee INR 75 and wallet return INR 75; no cash refund.
Automatic no-capacity/no-show/service failure	Full cash refund plus restoration of used credit; Customer late fee does not apply.

11. Quote and timing boundary

Use separate **human-authorized** bookings only when sufficient real capacity and merchant refund funds exist. Open Cancel and check exact cash return, wallet return and fee before confirming. If five minutes passes while the sheet is open, a stale confirmation must do nothing, refresh the quote and require a new human confirmation. Repeated taps/reopen must not add money twice.

Do not report "refunded" solely because a refund was queued. Check actual provider processed status and separately confirm original-method credit with the human. An unavailable provider/balance must remain pending/delayed and recover safely. Do not reduce a promised full refund to fit the merchant balance.

12. Reuse real returned credit

Home should show exact paise. Apply credit on the next Review screen: INR 74.50 credit against INR 149 leaves INR 74.50 cash. Excess credit stays available. A fully covered booking creates no external charge. If partial credit would leave less than Razorpay's INR 1 cash minimum, the tiny unused credit remains in wallet.

No dedicated wallet-history/withdrawal screen was invented. Existing Home, Review, Cancel and result controls implement this flow. A new activity page requires Aman's design and a separate decision; wallet withdrawal is not enabled.

7. Device recovery and notifications

13. Permissions, restart and poor network

Check camera, Photos, microphone and GPS first grant/deny/retry on both roles. Let the human change OS permissions. Cancel media selection without advancing. Test rotation/keyboard on existing layouts, narrow iPhone widths and large text. Do not redesign screens to hide a failing native handler.

Interrupt an upload/save, restore connection and retry. Reopen after a successful save. Background/foreground while paying, receiving an offer and washing: server state must recover without duplicate booking, money, photo, rating or earnings. Try duplicate taps at the normal controls. Never disable server role/ownership, payment, capacity, identity or photo gates to make a test pass.

14. APNs is blocked until the correct key is configured

Aman's only key task: privately provide the original Apple APNs **.p8**, its Key ID, paid team **28JNT7H8KA**, and allowed environment/topic details for **both** bundle IDs. Keep the file outside Git and public chat. Ajay's side uploads it to Firebase after receipt. Do not ask Aman to upload/configure Firebase, regenerate unrelated existing keys or send Apple passwords. The key-only prompt is `docs/AMAN-CLAUDE-APNS-KEY-ONLY-2026-10-30.md`.

After Ajay confirms configuration, test both native apps separately: foreground inbox, background/locked-screen notification and tap into the correct current booking. Test normal human-authorized booking events, not fake production users or artificial approval. Record actual delivery. A registered FCM token, enabled entitlement or a durable inbox item alone does not prove APNs delivery.

15. Remaining account and content checks

Verify profile, work hours, saved parking and sign-out/relogin. An unrelated reviewer account must not access admin data. Only test account deletion on a consenting disposable account with no outstanding work/money, at the end. Deleting Customer must preserve the separate Captain role and vice versa.

Support tickets use real backend state; approved support contact details and legal entity/terms/privacy content are still owner inputs. Missing approved content is **BLOCKED**, not a working-link PASS. Training remains hidden. No DigiLocker, WhatsApp Business, masked-call or voice-OTP acceptance is claimed.

8. Known findings and honest completion record

Read-only live audit on 30 October

Two existing INR 149 WashKrew LIVE UPI captures matched Firebase booking amounts and provider orders. One INR 149 refund is provider **processed** and matches Firebase. Another INR 149 original-policy refund remains **delayed/retrying**; the provider returned HTTP 400 BAD_REQUEST_ERROR and no refund record yet. These historical bookings do not prove the new five-minute/wallet policy or other payment methods. Actual bank-credit confirmation remains a human check.

The merchant dashboard showed **INR 141.96 current balance, INR 0 reserve and INR 0 refund credits**, a **INR 7.04 shortfall** against the INR 149 refund. This is a funding blocker consistent with Razorpay's documented balance requirement; the generic API error alone does not rule out other rejection causes. Check current funds and provider status again after funding, before further tests. Only the human can authorize a reserve top-up from the registered settlement account. The backend must keep the full amount owed and its original merchant. Do not submit an extra manual refund alongside an automatic retry.

What remains before launch acceptance

Owner / environment	Required evidence or input
Aman on Mac/iPhone	Both signed builds; camera/Photos/GPS, complete role sequence, payment chooser/app switch, receipts, actual new-policy early/late/mixed-wallet cases.
Aman -> Ajay	Private paid-team APNs key/details; Ajay configures Firebase, then both apps need real delivery tests.
Merchant owner	Resolve the outstanding full refund and keep enough refund/reserve balance. Actual bank credit, separate-method charges and payout transfers need human evidence.
Aman / business owner	Approved operating legal entity, support phone/email/hours, terms/privacy URL and commercial/service coverage inputs.
Apple account owner	Any paid-team/device access or company seller enrollment required by Apple.

Record each result

Copy `docs/IOS-ACCEPTANCE-RESULTS-TEMPLATE.md` to a dated private/local result. For each case record **NOT RUN, BLOCKED, FAIL or PASS**, source commit, app version/build, iPhone/iOS, expected/observed result and safe evidence. Do not pre-mark PASS. Keep private evidence and keys outside Git. Record any narrow fix commit and actual retest. Report ledger approval separately from bank payment.

Send Ajay the safe results and exact blockers after testing. A staging push and a web deployment do not install a native update or establish App Store approval.
